Inter-city comparison
- Of the 10 major Canadian municipalities, Winnipeg\(^1\) ranked 7th in terms of employment growth.
- Regina had the strongest employment growth (+3.9%).
- Saskatoon ranked last with the largest decrease (-3.1%).

Labour market indicator definitions

Labour force: The number of employed and unemployed persons.

Unemployment: Persons seeking employment in the prior 4 weeks, on temporary layoff or starting a new job within the next 4 weeks.

Participation rate: The labour force divided by the working age population.

Employment rate: Total employment divided by the working age population.

Unemployment rate: Total unemployment divided by the labour force.

---

Regina*: Includes Regina and Moose Mountain
Saskatoon**: Includes Saskatoon and Biggar
Vancouver***: Greater Vancouver area, the Fraser Valley and the Sunshine Coast, and stretches north to include Whistler, Pemberton and Lillooet

Technical note: seasonally adjusted labour market estimate for economic regions
Statistics Canada does not produce seasonally adjusted labour market indicators for the economic regions. The City of Winnipeg Economic Research Group (ERG) estimates seasonally adjusted labour market indicators using seasonal adjustment factors from provincial labour market data estimated by Statistics Canada. ERG seasonally adjusts Economic Region employment data at the industry level. We assume the seasonality for each industry (e.g. retail trade) at the provincial level is the same for the economic regions within that province. Prior to publication we check these estimates to ensure seasonality has been removed from the Economic Region estimates using statistical software. Seasonality for full-time and part-time employment at the provincial level is assumed to be the same for the economic regions and. The sum of full and part-time employment levels are constrained to total seasonally adjusted employment for the economic regions. ERG also assumes seasonality for unemployment is the same at the provincial level as it is for the economic regions. The sum of seasonally adjusted employment and unemployment estimates yields an estimate of the seasonally adjusted labour force. Statistics Canada does not seasonally adjust population (15+) in the labour force survey. Therefore the participation rate and employment rate are estimated using seasonally adjusted labour force and employment estimates with the original population (15+) estimates published by Statistics Canada.

\(^2\)2016 Winnipeg Census Metropolitan Area: This comprises the City of Winnipeg, 10 surrounding rural municipalities and Brokenhead 4 reserve.
Drivers of Manitoba’s CPI inflation
- As shown in chart 4, the top three contributors to Manitoba’s 2022 Q4 CPI inflation were transportation (+2.5%), shelter (+2.2%) and food (+2.0%).
- The remaining CPI subcategories all contributed to inflation. In descending order: household operations, furnishings and equipment (+1.0%), recreation, education and reading (+0.4%) health and personal care (+0.2%), alcohol, tobacco and recreational cannabis products (+0.1%) and clothing and footwear (+0.1%). Aside from shelter these details are not available for Winnipeg.

Chart 5: Winnipeg CMA shelter inflation, year-over-year quarterly averages, not adjusted for seasonality

Winnipeg\(^1\) shelter inflation
- The price index of shelter in Winnipeg\(^1\) increased by +7.2% in 2022 Q4 from 2021 Q4.
- All three subcategories of the shelter price index increased in 2022 Q4 from 2021 Q4. In descending order: owned accommodations (+9.5%), water, fuel and electricity (+7.2%) and rented accommodations (+2.0%).

Inter-city comparison
- Of the 10 major Canadian municipalities, Winnipeg\(^1\) had the highest CPI inflation for 2022 Q4 relative to 2021 Q4.
- Halifax had the second highest CPI inflation rate at +7.8%.
- Edmonton had the lowest CPI inflation rate at +6.2%.

What are contributing growth rates?
Contributing growth rates tell us how much each subcomponent is driving the overall growth of an indicator. The sum of the contributing growth rates of the subcomponents equals the overall growth rate of the indicator. For example, suppose CPI consisted of only food and shelter and their contributing growth rates were 2% and 3%, respectively. In this case total CPI inflation would be 5%.
