**RE: Sub-Surface Investigation Report for
20-C-03 Portage-Sargent Pavement Renewals**

TREK Geotechnical Inc. is pleased to submit our report for the sub-surface investigations for the 20-C-03 Portage-Sargent Pavement Renewals project.

Please contact the undersigned if you have any questions. Thank you for the opportunity to serve you on this assignment.

Sincerely,

TREK Geotechnical Inc.

1.0 Introduction

This report summarizes the results of the road investigation completed for the 20-C-03 Portage-Sargent Pavement Renewals – Sargent Ave. The test holes were located along Sargent Avenue between St. James Street and Empress Street. The information collected describes the pavement structure of the existing road as well as the soil stratigraphy beneath the pavement structure. The investigation was carried out in accordance with the City of Winnipeg public works street project requirements.

2.0 Road Investigation and Laboratory Program

The investigation included coring of pavement and drilling test holes at 7 locations as shown on Figure 01 (attached).

The road investigation was conducted between September 10, 2020 and September 11, 2020. The pavement structure (asphalt and/or concrete) was cored by Jashandeep Singh Bhullar of TREK Geotechnical Inc. (TREK) using a portable coring press equipped with a hollow 150 mm diameter diamond core drill bit. Seven test holes were drilled to a depth of 3.0 m below road surface by Maple Leaf Drilling Ltd. using a truck mounted drill rig equipped with 125 mm diameter solid stem augers. The sub-surface conditions were observed during drilling and soils were visually classified by Jashandeep Singh Bhullar of TREK. Other pertinent information such as groundwater and drilling conditions were also recorded during the drilling investigation. Disturbed (auger cuttings) samples and bulk samples retrieved during the sub-surface investigation were transported to TREK's material testing laboratory for further testing. Core samples were also retrieved and logged at TREK's material testing laboratory.

Test hole locations noted on the summary tables and test hole logs are based on UTM coordinates obtained using a hand-held GPS and their location relative to the nearest address, and measured distances from the edge of pavement or other permanent features.

The laboratory testing program consisted of moisture content determination on all samples, as well as Atterberg limits, and grain size analysis (mechanical sieve and hydrometer methods) on select samples between 0.5 and 1.1 m below pavement as well as Standard Proctor and CBR testing. Information gathered for each street is included in separate appendix A). The information provided in the Appendices includes test hole logs, laboratory testing summary tables and results, and photos of the concrete cores.

Four CBR's were completed on bulk samples of the soil units present below the pavement. Only clay and silt layers were encountered within the prescribed sample depth for CBR testing and the results are shown in the table below.

Table 1 - CBR Testing Summary

Sample Description	Test Hole	Depth (m)	SPMDD (kg/m ³)	Opt. Moisture (%)	Percent Proctor (%)	Moisture Content (%)	CBR Value at 2.54 mm	CBR Value at 5.08 mm
Clay	TH20-02	0.5 to 1.5	1687	19.5	95.6	20.7	4.9	4.1
Clay	TH20-04	0.5 to 1.5	1522	26.2	94.2	30.9	4.5	3.2
Silty Clay	TH20-05	0.5 to 1.5	1596	22.4	95.6	25.7	5.9	4.5
Clay	TH20-07	0.5 to 1.5	1498	26	95.7	30.3	7.9	5.1

* Testing completed on bulk grab samples from the top 1.5 m of each test hole.

The test hole logs include a description of the soil units encountered during drilling and other pertinent information such as groundwater conditions and a summary of the laboratory testing results. The soils were classified in general accordance with the Unified Soil Classification System (USCS) and the AASHTO soil classification system (American Association of state highway and transportation officials). The AASHTO system classifies soils based on laboratory testing results from Atterberg Limits and grain size testing methods (hydrometer and mechanical sieve method). Where laboratory testing was not conducted, the AASHTO classification of the soils was interpreted based on a visual assessment as indicated with a (I) on the test hole logs and attached tables. For cohesive soils, the AASHTO system uses a combination of testing results to determine the Group Index of the soils and were only determined where sufficient laboratory test data was available.

3.0 Closure

The information provided in this report is in accordance with current engineering principles and practices (Standard of Practice). The findings of this report were based on information provided (field investigation, laboratory testing, geometries). Soil conditions are natural deposits that can be highly variable across a site. If sub-surface conditions are different than the conditions previously encountered on-site or those presented here, we should be notified to adjust our findings if necessary.

All information provided in this report is subject to our standard terms and conditions for engineering services, a copy of which is provided to each of our clients with the original scope of work, or a mutually executed standard engineering services agreement. If these conditions are not attached, and you are not already in possession of such terms and conditions, contact our office and you will be promptly provided with a copy.

This report has been prepared by TREK Geotechnical Inc. (the Consultant) for the exclusive use of Morrison Hershfield (the Client) and their agents for the work product presented in the report. Any findings or recommendations provided in this report are not to be used or relied upon by any third parties, except as agreed to in writing by the Client and Consultant prior to use.

GENERAL NOTES

1. Classifications are based on the United Soil Classification System and include consistency, moisture, and color. Field descriptions have been modified to reflect results of laboratory tests where deemed appropriate.
2. Descriptions on these test hole logs apply only at the specific test hole locations and at the time the test holes were drilled. Variability of soil and groundwater conditions may exist between test hole locations.
3. When the following classification terms are used in this report or test hole logs, the primary and secondary soil fractions may be visually estimated.

Major Divisions		USCS Classification	Symbols	Typical Names	Laboratory Classification Criteria		ASTM Sieve sizes
Fine-Grained soils (More than half the material is smaller than No. 200 sieve size)	Silts and Clays (Liquid limit less than 50)	GW		Well-graded gravels, gravel-sand mixtures, little or no fines	$C_U = \frac{D_{60}}{D_{10}}$ greater than 4; $C_C = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ between 1 and 3	Not meeting all gradation requirements for GW	
		GP		Poorly-graded gravels, gravel-sand mixtures, little or no fines	Atterberg limits below "A" line or P.I. less than 4	Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols	#10 to #4
		GM		Silty gravels, gravel-sand-silt mixtures	Atterberg limits above "A" line or P.I. greater than 7	Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols	#40 to #10
		GC		Clayey gravels, gravel-sand-silt mixtures	$C_U = \frac{D_{60}}{D_{10}}$ greater than 6; $C_C = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ between 1 and 3	Not meeting all gradation requirements for SW	#200 to #40
		SW		Well-graded sands, gravelly sands, little or no fines	Less than 5 percent.....GW, GP, SW, SP More than 12 percent.....GM, GC, SM, SC 6 to 12 percent.....Borderline cases requiring dual symbols*	Atterberg limits below "A" line or P.I. less than 4	< #200
		SP		Poorly-graded sands, gravelly sands, little or no fines	Atterberg limits above "A" line or P.I. greater than 7	Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols	
		SM		Silty sands, sand-silt mixtures			
		SC		Clayey sands, sand-clay mixtures			
		ML		Inorganic silts and very fine sands, rock floor, silty or clayey fine sands or clayey silts with slight plasticity			
		CL		Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays			
		OL		Organic silts and organic silty clays of low plasticity			
		MH		Inorganic silts, micaceous or distomaceous fine sandy or silty soils, organic silts			
		CH		Inorganic clays of high plasticity, fat clays			
		OH		Organic clays of medium to high plasticity, organic silts			
		Pt		Peat and other highly organic soils	Von Post Classification Limit	Strong colour or odour, and often fibrous texture	

* Borderline classifications used for soils possessing characteristics of two groups are designated by combinations of group symbols.
For example; GW-GC, well-graded gravel-sand mixture with clay binder.

Other Symbol Types

	Asphalt		Bedrock (undifferentiated)		Cobbles
	Concrete		Limestone Bedrock		Boulders and Cobbles
	Fill		Cemented Shale		Silt Till
			Non-Cemented Shale		Clay Till

EXPLANATION OF FIELD AND LABORATORY TESTING

LEGEND OF ABBREVIATIONS AND SYMBOLS

LL	- Liquid Limit (%)	▽ Water Level at Time of Drilling
PL	- Plastic Limit (%)	▼ Water Level at End of Drilling
PI	- Plasticity Index (%)	■ Water Level After Drilling as Indicated on Test Hole Logs
MC	- Moisture Content (%)	
SPT	- Standard Penetration Test	
RQD	- Rock Quality Designation	
Qu	- Unconfined Compression	
Su	- Undrained Shear Strength	
VW	- Vibrating Wire Piezometer	
SI	- Slope Inclinometer	

FRACTION OF SECONDARY SOIL CONSTITUENTS ARE BASED ON THE FOLLOWING TERMINOLOGY

TERM	EXAMPLES	PERCENTAGE
and	and CLAY	35 to 50 percent
"y" or "ey"	clayey, silty	20 to 35 percent
some	some silt	10 to 20 percent
trace	trace gravel	1 to 10 percent

TERMS DESCRIBING CONSISTENCY OR COMPACTION CONDITION

The Standard Penetration Test blow count (N) of a non-cohesive soil can be related to compactness condition as follows:

<u>Descriptive Terms</u>	<u>SPT (N) (Blows/300 mm)</u>
Very loose	< 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	> 50

The Standard Penetration Test blow count (N) of a cohesive soil can be related to its consistency as follows:

<u>Descriptive Terms</u>	<u>SPT (N) (Blows/300 mm)</u>
Very soft	< 2
Soft	2 to 4
Firm	4 to 8
Stiff	8 to 15
Very stiff	15 to 30
Hard	> 30

The undrained shear strength (Su) of a cohesive soil can be related to its consistency as follows:

<u>Descriptive Terms</u>	<u>Undrained Shear Strength (kPa)</u>
Very soft	< 12
Soft	12 to 25
Firm	25 to 50
Stiff	50 to 100
Very stiff	100 to 200
Hard	> 200

California Bearing Ratio Test Data Sheet

ASTM D1883-16

Project No.	1000-001-21	Source	on-site
Client	Morrison Hershfield	Material	Clay
Project	20-C-03 Portage-Sargent	Sample Date	9/11/2020
Sample #	TH20-02	Test Date	9/22/2020
		Technician	AD

Proctor Results (ASTM D698)

Maximum Dry Density	1522 kg/m ³
Optimum Moisture Content	26.2 %
Material Retained on 19 mm Sieve	0.0 %

CBR Sample Compaction

Dry Density	1434 kg/m ³
Initial Moisture Content	30.9 %
Relative Density	94.2 % SPMDD

Soaking Results

Surcharge	4.54 kg
Swell	0.6 %
Moisture Content in top 25 mm	36.7 %
Immersion Period	96 h

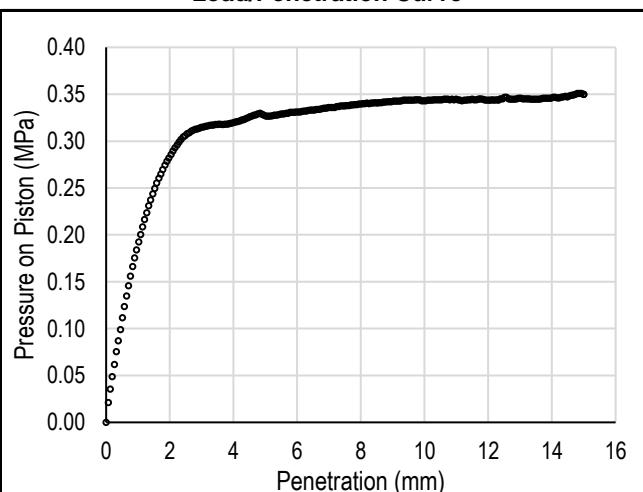

CBR Results

CBR at 2.54 mm	4.5 %
CBR at 5.08 mm	3.2 %
Zero Correction	0 mm

Test Data

Penetration (mm)	Measured Pressure (MPa)	Corrected Pressure (MPa)
0.64	0.14	0.14
