## **BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022**

### **EXECUTIVE SUMMARY**

---

The Brady Road Resource Management Facility (BRRMF) is the City of Winnipeg's only active landfill. The site is bordered by the Perimeter Highway on the north, Waverley Street on the east, Brady Road and the R.M. of Macdonald on the west, and Rue des Trappistes on the south. The landfill has been in operation since 1973 and is estimated to have sufficient capacity for over 100 years, assuming current waste diversion practices are continued.

Environment Act Licence No. 3081 R, issued on April 23, 2014, requires the City of Winnipeg to submit an annual report on or before April 15<sup>th</sup>, detailing activities conducted at BRRMF in the previous year. This report provides a summary of major expenditures and construction, major incidents, waste diversion operations, ground water management, surface water management, leachate management, landfill gas management, and nuisance management for 2022.

Major construction in 2022 included paving the cell access road (north-south road off the main road past Cells 30 - 33) and composting organic waste for the Residential Food Waste Collection Pilot Project. In 2022, there were no disruptions or failures of waste management practices due to equipment breakdown, no major spills occurred, and no alarms were activated.

In 2022, approximately 38% of the 507,807 metric tonnes of material received at the BRRMF were beneficially re-used, composted, or removed from the site for further processing or beneficial re-use. In addition, 41,762 kL of leachate was hauled to the North End Sewage Treatment Plant for treatment.

Monitoring programs for leachate, ground water, surface water, and subsurface gas migration followed the sampling and analysis plans in 2022 and contingency plans were not activated.

Statistical analyses of analytical results obtained for leachate, ground water, and surface water indicate that the BRRMF has not had a negative impact on the ground water and surface water downstream of the site.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 1.0 INTRODUCTION

---

The Brady Road Resource Management Facility (BRRMF) is located south of the Perimeter Highway, between Brady Road and Waverley Street. Residential land use is present within 500 m of the site to the east and within 120 m north of the site (Waverly West development), other surrounding land use is agricultural. Opened in 1973, the 790-hectare, Class 1 Solid Waste Disposal facility currently holds approximately 12 million metric tonnes of waste, with over 300,000 metric tonnes of waste materials landfilled on an annual basis. The site has capacity for over 100 additional years of waste disposal, assuming current waste diversion practices are continued.

The BRRMF operates in accordance with Environment Act Licence No. 3081 R, which was issued on April 23, 2014. Clause 127 of the license requires the City of Winnipeg to prepare and submit an Annual Report on the activities undertaken at the site during the previous year on or before April 15th of each year. This report contains results and/or comments for each of the clauses of Licence No. 3081 R under which the BRRMF has generated pertinent information during 2022. The report also provides information on the BRRMF proposed activities for 2023.

The layouts of the primary components of the BRRMF are shown on Figure 1. Surface water flows are managed by perimeter ditching and retention ponds. The ground water monitoring network consists of wells in the bedrock, till, and clay layers. The leachate collection system is a network of manholes/risers, drains, and sumps around the perimeter of the landfill cells, which feed into a centralized collection tank/truck fill station. The landfill gas (LFG) management system includes extraction wells, collection piping, and a blower/enclosed flare station.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 2.0 MAJOR ACTIVITIES AND CONSTRUCTION

---

Major activities and construction undertaken in 2022 included:

- paving the cell access road (north-south road off the main road past Cells 30 - 33)
- composting organic waste for the Residential Food Waste Collection Pilot Project

Major activities and construction planned for 2023 include:

- final design and construction of the new waste cell 34
- planting trees and greenery around the administration building and throughout the landfill to assist in wind breaking and odour mitigation
- additional fencing on the north side of the site to assist with litter capture and control

### 3.0 MAJOR INCIDENTS

---

In 2022, there were no disruptions or failures of waste management practices due to equipment breakdown, no major spills occurred, and no alarms were activated.

### 4.0 WASTE DIVERSION OPERATIONS

---

In 2022, the BRRMF received 507,807 metric tonnes of material from a variety of sources including residential waste collection, residential food waste collection (pilot project), commercial wastes, wastes from City operations, and materials dropped off at the 4R depots. Composting programs, on-site re-use of materials, and removal of materials from the site for re-use or further processing allowed 190,943 metric tonnes of material to be diverted from the landfill. The remaining 316,864 metric tonnes of material was landfilled. The 38% diversion rate in 2022 is a slight increase from the previous year due to an increase in the amount of compostable materials received.

The 2-year Residential Food Waste Collection Pilot Project concluded at the end of September 2022. The project involved curbside collection of residential food waste from 4,000 households, and included waste audits, surveys, and data gathering activities to help inform decisions towards a city-wide program. The results of the pilot project will be presented to City Council in Q2 of 2023. In 2022, 258 metric tonnes of food waste was composted at the BRRMF; the resulting material was used onsite.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

In 2022, 9,925 metric tonnes of biosolids were mixed with woodchips and clay to create a fabricated soil that will be used as final cover at the BRRMF. No biosolids were landfilled or composted at the biosolids composting facility. In 2023, biosolids composting will occur on an as-needed basis to meet final cover needs.

In 2023, we will continue fabricating soil from biosolids, composting organic materials, and diverting re-useable wastes from the landfill.

A summary of the BRRMF Waste Diversion Operations is provided in Table 1.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 5.0 GROUND WATER, SURFACE WATER, LEACHATE, AND LANDFILL GAS MONITORING

---

#### 5.1 GROUND WATER

The land beneath the BRRMF consists of three layers: the uppermost layer is clay (averaging 12 m in thickness), the second layer is till (averaging 6 m in thickness), and the lowest layer is bedrock. Ground water flows downwards through the clay and till layers into the bedrock aquifer, which flows in a north-east direction. The ground water in all three layers is saline and non-potable. The major ions in the ground water from the clay layer are calcium, magnesium, sulfate and bicarbonate. Sodium and chloride are the major ions in the bedrock aquifer. Ground water in the till layer is generally intermediate in brackishness and shows a gradual change with depth. The ground water monitoring system includes 34 nested wells: 13 bedrock wells, 13 till wells, and 8 clay wells. The locations of the ground water monitoring wells are shown on Figure 2.

As per the BRRMF Operating Plan, ground water is monitored in accordance with the Ground Water Sampling and Analysis Plan (SAP), as specified under Clause 123. Sampling frequency is twice per year for bedrock wells and downgradient till wells, and once per year for clay wells and other till wells distant from the waste areas. As neither Federal nor Manitoba Provincial Governments regulate non-potable ground water quality, the Ontario Ministry of Environment (MOE) guidelines for non-potable groundwater quality are used as the regulatory guideline (MOE, 2011).

In 2022, a total of 51 ground water samples were analyzed – 4 samples from wells upgradient of the site (background water quality), and 47 samples from wells cross gradient and downgradient of the site. There were no deviations from the Ground Water SAP or from normal sample collection and preservation practices, although well 16A was struck by onsite equipment; the original well was decommissioned and a new well was drilled. Results for several parameters were variable between different wells of the same type, and also between spring and autumn results at the same well. The results met the guidelines with the exception of chloride in one till well and most of the bedrock wells, and dissolved selenium was above the guideline in one till sample. The 2022 ground water results are provided in Tables 2.1-2.3.

Note: Criteria exceedances are highlighted in red.

\* Criteria for total chloride and total metals

na - not analysed; instrument malfunction

\*nr - contract lab QC failure

\*\*nr - technician error

## **BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022**

The 2018-2022 average results are provided in Tables 3.1-3.3. Although the average concentration of some metals are higher in the down and cross gradient samples than in the upgradient samples, they are below the MOE guidelines. The average dissolved chloride concentration often exceeds the MOE guideline of 2,300 mg/L in both upgradient and down and cross gradient samples.

The Piper diagrams provided in Appendix A display tight groupings of ground water sampling data, which is indicative of no significant ground water chemical changes.

Time versus concentration graphs provided in Appendix B show the historical relationship of the analytical parameters at each monitoring location. In general, the analytical results for ground water obtained in 2022 were found to be similar to those obtained in 2018-2021, and are consistent with background levels.

The Contingency Action Plan identified under Clause 125 was not implemented in 2022.

At this time, we have no recommendations for changes to the ground water monitoring program, although we are working on a reassessment of our ground water monitoring test parameters and sampling frequency in 2023.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 5.2 SURFACE WATER

Surface water flows at the BRRMF are managed by perimeter ditching and the central access road, which creates a barrier between the impacted water ditches on the north and the clean water ditches on the south; there are also eight surface water retention ponds. The system is designed to run dry for most of the year, as such, grab sampling is performed three times per year: spring run-off, summer run-off, and autumn run-off. The surface water sampling points are shown in Figure 3.

As per the BRRMF Operating Plan, surface water is managed in accordance with the Surface Water Sampling and Analysis Plan (SAP), as specified under Clause 115. Compliance parameters are applied to the upstream and downstream sampling points, with modifications at other locations interior to the site. Sampling for the clean water ponds (SWQ-25-9a and b) is similar to sampling for perimeter ditching. Sampling for impacted water ponds: Active Area Collection Pond (SWQ-25-6), Biosolids Storm Water Pond (SWQ-25-7), Leaf and Yard Waste Storm Water Pond (SWQ-25-8) and dry ponds (SWQ-25-11 a, b, and c) is performed prior to discharge events. The Canadian Council of Ministers of the Environment (CCME) Water Quality Guidelines for the Protection of Freshwater Aquatic Life are used as the regulatory guideline (CCME, 2019). Weekly field monitoring is performed at the weir from spring thaw to freeze-up.

In 2022, a total of 35 surface water samples were analyzed – three upstream samples, five downstream samples, eleven interior samples, and sixteen pond samples. There were no deviations from the Surface Water SAP or from normal sample collection and preservation practices. Weekly weir data is provided in Table 4 and the 2022 surface water results are provided in Tables 5.1 and 5.2.

The analytical results for some of the pond samples exceeded the guidelines for pH, nitrate, cyanide, arsenic, cadmium, copper, iron, selenium, and zinc; the water was retained in the ponds or hauled for treatment as required. Some of the analytical results for perimeter ditching were highly variable between sample points, and between sample dates at the same location, but were below the CCME guidelines. The concentration of iron exceeded the CCME guideline at the upstream location and at two interior locations, but was below the guideline limit at the downstream locations. Arsenic exceeded the guideline at the upstream, as well as interior and downstream locations, this is due to its natural occurrence in Manitoba soils. Dissolved chloride was lower in 2022 than in previous years due to heavy snowfall in March and April and heavy rainfall in May and June.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

The 2018-2022 results for upstream and downstream locations are provided in Table 6 and time versus concentration graphs showing the historical relationship of the analytical parameters at each monitoring location are provided in Appendix B. The analytical results for surface water are variable between locations and year over year, but are generally higher at the downstream locations, although only arsenic and copper exceeded the CCME guidelines at the downstream location in 2022.

The Contingency Action Plan identified under Clause 125 was not implemented in 2022.

At this time, we have no recommendations for changes to the surface water monitoring program, although we are working on a reassessment of our surface water monitoring test parameters and sampling frequency in 2023.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 5.3 LEACHATE

The leachate management system is a network of manholes/risers, drains, and sumps around the perimeter of the landfill cells, which feed into a header pipe. The leachate flows via gravity and lift stations into a 300,000L storage tank located at the intersection of Charette Road and the access road, which acts as a truck fill station for hauling to the North End Sewage Treatment Plant for treatment. Leachate can also be pumped from eleven collection manholes and one riser if needed; these sites also serve as sampling points. The locations of the manholes and riser are shown on Figure 1.

As per the BRRMF Operating Plan, leachate is managed in accordance with the Leachate Sampling and Analysis Plan (SAP), as specified under Clause 100. The MOE guidelines for non-potable groundwater quality are used as the regulatory guideline (MOE, 2011).

The total volume of leachate removed from the BRRMF in 2022 was 41,762 kL. There were no occurrences of leachate breakout from the development in 2022. The Contingency Action Plan identified under Clause 125 was not implemented in 2022.

In 2022, twelve leachate samples were analyzed; there were no deviations from the Leachate SAP or from normal sample collection and preservation practices. Monthly leachate elevations are provided in Table 7, and the 2022 leachate results are provided in Table 8. The majority of parameters were highly variable between manholes; some of the samples exceeded the MOE guidelines for chloride, nickel, sodium, zinc, extractables, and hydrocarbons. Leachate is highly variable due to waste composition, amount of precipitation, site hydrology, waste compaction, cover, and interaction of leachate with the environment.

The 2018-2022 average results are provided in Table 9, and Piper diagrams showing the historical relationship of cations and anions at each monitoring location are provided in Appendix A. Many of the parameters measured vary significantly from year to year, although the average results meet the MOE guidelines, with the exception of zinc, which sometimes exceeds the guideline.

We have no recommendations for changes to the leachate monitoring program at this time, although we are working on a reassessment of our leachate monitoring test parameters and frequency in 2023.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 5.4 LANDFILL GAS

#### 5.4.1 COLLECTION AND FLARING SYSTEM

Landfill gas (LFG) produced at the BRRMF is comprised primarily of methane ( $\text{CH}_4$ ) and carbon dioxide ( $\text{CO}_2$ ) in approximately equal amounts. These greenhouse gases contribute to global warming, but  $\text{CH}_4$  has a global warming potential 25 times that of  $\text{CO}_2$ . To reduce emissions, the LFG is collected via a series of pipes beneath the BRRMF, and sent to a flare where the  $\text{CH}_4$  is reduced to  $\text{CO}_2$  and water vapor. The landfill gas collection and flaring system (LFGCFS) is run by Integrated Gas Recovery Systems Inc. on behalf of the City of Winnipeg.

As per the BRRMF Operating Plan, LFG operations and monitoring are managed through the Landfill Gas Operating Plan, submitted October 23, 2014, as per Clause 110.

During operation in 2022, the LFGCFS operated as was intended. With the exception of the extended shutdown due to the header being compromised in March 2022. During surface emission monitoring, some areas with weak surface cap were noted where gas was escaping.

The 2022 Landfill Gas Collection and Flaring Report, prepared by Integrated Gas Recovery Services Inc., is attached in Appendix C.

#### 5.4.2 SUBSURFACE LANDFILL GAS MONITORING PROGRAM

LFG that is not collected or that cannot escape into the atmosphere may migrate into neighboring land below the ground surface. The purpose of LFG migration monitoring is to detect gas migration before it becomes a safety hazard to neighbouring properties.

As per the BRRMF Operating Plan, subsurface LFG migration is managed in accordance with the Subsurface Landfill Gas Monitoring Program, submitted on October 23, 2014, as specified under Clause 111. Probes are monitored monthly for methane ( $\text{CH}_4$ ), oxygen ( $\text{O}_2$ ), carbon monoxide (CO), and hydrogen sulphide ( $\text{H}_2\text{S}$ ).

In 2022, the maximum level of  $\text{CH}_4$  measured was 0.2%. The Subsurface Landfill Gas Contingency Plan was not activated, indicating that the LFGCFS is operating effectively.

The 2022 subsurface gas migration probe data is provided in Table 10.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 6.0 NUISANCE MANAGEMENT

---

In order to reduce odour, litter, and vector nuisances at the landfill, several best practices and operating procedures are used, such as placement of screens, minimizing the working face of each cell, application of appropriate cover material (daily, intermediate, or final), site landscaping, weekly litter control patrols, and odour monitoring. If necessary, a licensed professional will apply vector control products, ensuring that appropriate chemicals are used and are properly handled. Noise is not a significant issue due to the separation from surrounding homes. Fugitive dust emissions are minimized by spraying site roads with uncontaminated surface water.

In 2022, there were 73 odour complaints; in all cases the source of the odour was investigated. If the source of the odour could be located within the BRRMF, if possible, we immediately covered the odour causing material, moved the tipping face to a more favorable area if available, and used compost or wood chips to reduce the odour and prevent further occurrence. Appendix D provides a summary of nuisance complaints received in 2022.

## BRADY ROAD RESOURCE MANAGEMENT FACILITY ANNUAL REPORT – 2022

### 7.0 CONCLUSION

---

The diversion operations taking place at the BRRMF have been effective in diverting tens of thousands of metric tonnes of material from the landfill.

The quality of the ground water beneath the site has not been negatively impacted, as demonstrated by the comparison of upstream to downstream ground water quality.

The quality of the surface water measured at the weir is statistically similar to the quality of the surface water upstream of the BRRMF.

Leachate management was successful in 2022 as there were no breakouts of leachate.

The areas where landfill gas is escaping should be repaired.

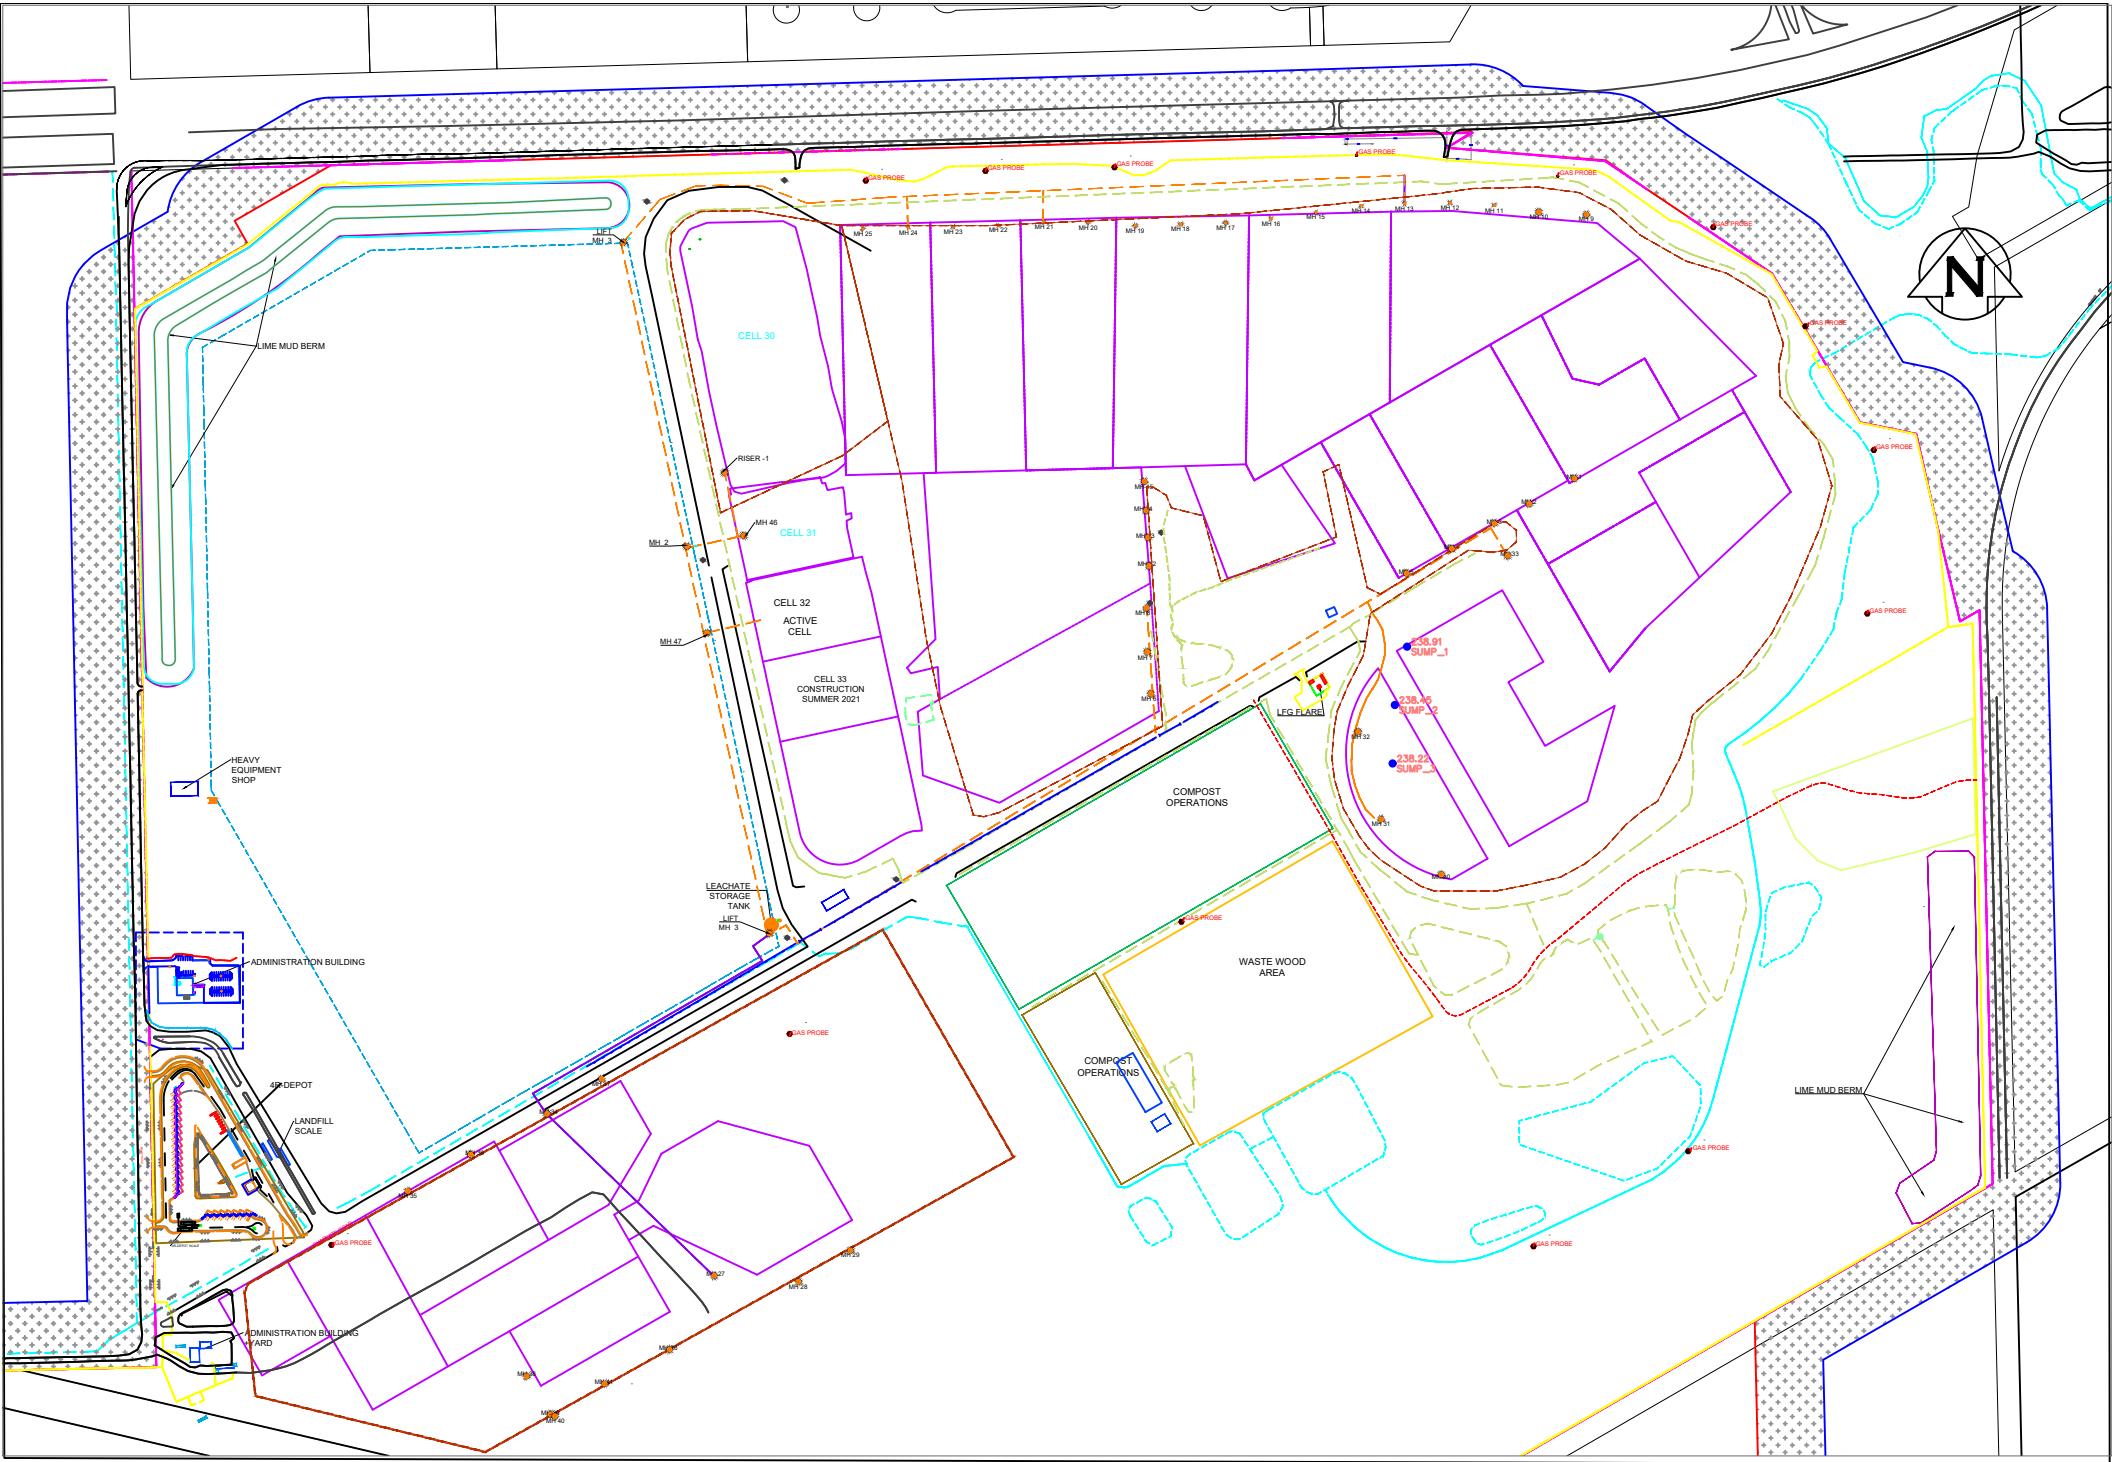

The BRRMF will continue to operate so as to ensure that the environment is maintained in such a manner as to sustain a high quality of life, including social and economic development, recreation and leisure for present and future Manitobans.

## 1.0 INTRODUCTION

The City of Winnipeg operates the Landfill Gas Collection and Flaring System at the Brady Road Resource Management Facility in Winnipeg, Manitoba, which operates under Manitoba Conservation Licence 3081. After a commissioning phase, the system became operational full time in August 2013 after approval to operate was received by the Office of the Fire Commissioner.

Operation of the system including maintenance and monitoring was completed by Comcor Environmental Limited (Comcor) on behalf of its partner Integrated Gas Recovery Services (IGRS).

This report outlines work performed and data collected during the operation of the Landfill Gas Collection and Flaring System in 2022.

## 2.0 LANDFILL GAS COLLECTION SYSTEM

There are two main components of the LGCS that require monitoring. These include:

- Landfill Gas Collection Wellfield
- Mechanical System

The purpose and procedures associated with the monitoring of each of these components are discussed separately below. The recommended monitoring frequency is presented in Table 1.

**Table 1: Summary of Monitoring Frequency**

System Component	Monitoring Frequency
Wellfield Monitoring	Monthly
Remote Mechanical System Monitoring	Weekly
Mechanical System Monitoring	Weekly

### 2.1 Wellfield System Expansions

No wellfield expansions occurred in 2022.

In November and December 2022, extensive repairs were completed on lateral 7 to repair longstanding vacuum issues on the lateral. Three wells were non-operational due to multiple low points along lateral 7 caused by differential settlement. These low points had filled with water and caused a lack of vacuum at some wells. Tervita was contracted to complete the repairs and vacuum was restored to all three wells successfully.

Figure 1 presents existing wellfield conditions at the site.

### 2.2 Wellfield System Monitoring

The wellfield system monitoring consists of measuring vacuum/pressure in each well and lateral pipe, the percentage of methane, oxygen and carbon dioxide in the landfill gas, and parts per million of carbon monoxide and hydrogen sulphide at each location. These measurements were

2022 Annual Report – Landfill Gas Collection and Flaring System  
Brady Road Resource Management Facility, Winnipeg, MB  
**City of Winnipeg**

taken using a portable gas meter/analyser such as a Landtec GEM-5000, or equivalent. Vacuum fluctuations were noted, as it can be an indication of water within the piping system.

Each wellhead was monitored for the velocity of gas using an anemometer. The measured velocities were used to calculate landfill gas flow rates by multiplying the velocity by the pipe cross-sectional area.

The monitoring data collected during the monthly round is beneficial to determine if the wellfield is operating as intended. Changes to the wellhead valve position were made to ensure maximum gas collection from the landfill. The system was monitored and field balanced by a technician experienced in the operation of this type of system.

During 2022, there were no elevated levels of Carbon Monoxide (CO) (>500 ppm). During the 2022 monitoring period, the highest CO level recorded at GW 1-7 was 56 ppm and 68 ppm at GW 2-13. Elevated carbon monoxide within landfill gas can be an indicator of a subsurface fire within the waste. There was no indication of a subsurface fire in 2022.

In February 2022, Comcor observed heavy water surging on the north side of the site and found the North Header to be completely flooded. This blockage caused a complete lack of vacuum on Lateral 8 and the west header piping. Further investigation revealed that the wellfield vacuum was also not present at gravity drain trap GDT4 and the landfill gas wellhead at leachate manhole MH22. It was determined that a pneumatic pump in one of the manholes was not functioning due to the cold weather, causing the header to flood. The pump was replaced and the issue was resolved.

In March 2022, there was a complete site shutdown due to an incident with the header piping between PDT2 and PDT3. While clearing the ditches of snow an excavator came into contact with the south header piping as well as the compressed air and force main lines that accompanied it. The excavator severed the pipes which caused large amounts of water to enter the LFG system. This flooded all South header piping as well as the blowers within the flaring compound. This left the system down for multiple days while the issues were addressed. This section of the header was eventually isolated from the system while repairs were completed. After the repair, water continued to be an issue within the header for multiple weeks before finally being cleared by gravity and pump drain traps.

The wellfield monitoring data and valve positions can be found in Table 2.

Pump counter measurements were recorded on a monthly basis at all active dual-purpose gas/leachate collection wells. During the monthly pump counter measurements, the following items were noted:

- A large number of the pumps were frozen due to the extreme cold and were not functional during most of the winter.
- All pumps on Lateral 2 are non-functional due to a compressed air leak on the main line beginning in February 2022.
- Various counters were replaced as needed.
- The pump counters at PDT4, PDT5, PDT7 and PDT9 were not functioning throughout the 2022 reporting year due to flooding, thus readings were not recorded.

## 2022 Annual Report – Landfill Gas Collection and Flaring System Brady Road Resource Management Facility, Winnipeg, MB City of Winnipeg

In instances when there was a lack of a functioning pump counter, the pumps were checked on a monthly basis to confirm operation, and were found to be operating as intended at all inspections. Table 3 presents the pump counter measurements recorded at both the pump drain traps and active dual-purpose wells in 2022.

Water level monitoring requirements are for water levels to be measured on a semi-annual basis. In 2022, an additional round was completed to total three events in April, August and December. Table 4 presents the water levels measured in 2022. The percent of open screen available for gas collection at each well is estimated based on water levels.

Based on pump counters and water levels recorded throughout 2022, dual purpose well pumps continue to remove leachate consistently. In 2022, the average open screen percentage of the monitored dual-purpose wells was 48.5%.

Throughout the year pumps at all wells were pulled and checked for operation. Few issues were found with the pumps and they were largely found to be in good condition, with the exception of four wells, where the pumps are currently stuck inside the wells. A full list of wells with stuck pumps will be prepared in Spring 2023.

Winter operations of the dual purpose wells have been a concern since their installations. As an attempt to alleviate freezing in these wells, well insulation was purchased and installed. Although the insulation was successful in the Fall of 2022, by the end of year freezing was beginning to occur in a large number of the wells. For 2023 additional insulation or means to protect the wells should be investigated.

### 2.3 Surface Emission Monitoring

As required by the City, surface emission monitoring is requested to be carried out on a quarterly basis, weather conditions permitting, by Comcor. In 2022 the surface emissions monitoring was completed twice due to restrictions with weather conditions. This monitoring is performed using a Landtec SEM or similar with integral GPS, marking locations where concentrations of hydrocarbons were greater than 500 ppm. The surface emission monitoring was completed in May and November for the 2022 reporting year. Several areas were noted where there were significant volumes of gas detected, including areas where cap was weak and pipe penetrated the landfill cap. In previous surveys, manholes were identified as significant sources of surface emissions, however since completion of the leachate manhole/sump lid retrofits, only very low emissions were detected. The reports from the two surface emission monitoring events in 2022 have been included in Appendix B.

### 2.4 Mechanical System Monitoring

The main operational control of the mechanical system is carried out by the Programmable Logic Controller (PLC). The PLC also provides information on the operating status of the system, and records all data electronically which can be downloaded when required. Specific details on these items are included in the Flare Operation and Maintenance Manual. At a minimum the PLC records:

- Landfill gas composition and temperature;
- Flare operating times;

- Blower operating times;
- Landfill gas flow rate;
- Volume of landfill gas collected and flared; and
- Greenhouse Gas Emission Reduction in CO<sub>2</sub> equivalents.

These items were also monitored remotely and were reviewed at minimum on a weekly basis to ensure that all parameters outlined above are being recorded and that all system data indicates that the overall system is operating properly. The system review was carried out by a technician experienced in the operation of such systems.

Comcor staff also carried out the maintenance of the system as outlined by the Operations and Maintenance Manual. Other notable maintenance that was performed in 2022 included:

- Replacement of flare flame scanners; and
- Replacement of the gas analyzer main motor due to failure.

Data for 2022 has been compiled, and is found in Appendix A.

#### **2.4.1      System Pressure Measurements**

Monitoring ports at the inlet and outlet to the blower were measured and recorded on a monthly frequency, using a suitably scaled pressure gauge. Gauge fluctuations were noted, as it can be an indication of water within the system.

Data for 2022 has been compiled, and is found in Table 2.

#### **2.4.2      System Gas Measurements**

The purpose of the main blower skid gas analyzer system is to monitor the oxygen and methane concentrations of the landfill gas being transferred by the LGFCS to the flare. As a safety precaution, if either the oxygen concentration gets too high, or the methane concentration gets too low, an alarm is sent to the main computer control panel PLC to shut the system down. Having records of the gas concentrations also allows for better analysis of the system and aids in troubleshooting when problems arise.

A pump, located within the gas analyzer system cabinet in the control room, is used to draw a continuous sample of process gas from the header pipe on the blower discharge side. After entering the analyzer, the sample is drawn through a de-mister and a series of filters to remove any particulate or moisture that may affect the monitoring equipment. The methane and oxygen concentrations of the sample are then measured by an infra-red methane analyzer and oxygen analyzer. The methane and oxygen concentrations are displayed on separate LED display screens mounted on the front face of the gas analyzer panel. The gas analyzer system will send signals to the PLC that will trigger a number of system alarms/warnings including low methane and high oxygen.

All system failures and/or alarms are displayed on the main control circuit panel. Any alarms that shut down the system are relayed by the auto messaging to the system operator.

## 2022 Annual Report – Landfill Gas Collection and Flaring System Brady Road Resource Management Facility, Winnipeg, MB **City of Winnipeg**

During 2022, the system operated as intended aside from the aforementioned motor failure, with the analyzer data recorded at an interval of five minutes or better and any system alarms were sent to the operator. This data was recorded and summarized into a daily value and can be found in Appendix A.

In addition to the main system analyser, concentrations of methane ( $\text{CH}_4$ ), carbon dioxide ( $\text{CO}_2$ ) and oxygen ( $\text{O}_2$ ) were measured manually, recorded monthly at the blower inlet and blower outlet, and compared to the insitu monitoring devices to ensure accuracy. These measurements were taken using a gas meter/analyser such as a Landtec GEM-5000+, or equivalent.

### **2.4.3      System Flow Rate Measurements**

Landfill gas velocities and temperatures at each landfill gas extraction well in the wellfield were measured and recorded on a monthly basis using an anemometer, if possible. These velocities were used to calculate landfill gas flow rates by multiplying by the pipe's cross sectional area.

A thermal mass flow meter continuously calculates flows to the flare and this data was recorded on an interval of 5 minutes or less.

The monitoring completed in 2022 is found in Table 2 and a summary of daily plant data can be found in Appendix A.

## **3.0    FLARE AND GREENHOUSE GAS EMISSIONS**

### **3.1      Flare Emissions**

The flare stack is equipped with four thermocouples that measure the temperature in the flare stack. These thermocouples are monitored by the system control panel PLC at intervals of 5 minutes or better. The control system is continuously monitoring the flame conditions and will shut down the LGCFS system immediately if flame is lost.

If the system shuts down for any reason, the fail-safe valve will close and prevent any non-combusted landfill gas from being released to the atmosphere, thereby controlling the emissions from the flare.

### **3.2      Greenhouse Gas Emissions**

The landfill gas is comprised of primarily methane and carbon dioxide in approximately equal amounts. In addition, there are other trace amounts of a large number of compounds. Methane and carbon dioxide are greenhouse gases but methane has a global warming potential 25 times that of carbon dioxide. By combusting the methane in the flare the resultant products are carbon dioxide and water vapour which reduces its global warming potential by approximately 95 percent.

The control panel records both flow and methane gas concentration being collected from the system and being sent to be combusted in the flare. These quantities are measured and recorded at intervals of 5 minutes or less. The data collected can be readily processed to calculate the greenhouse gas emission reduction expressed as carbon dioxide equivalents.

## 2022 Annual Report – Landfill Gas Collection and Flaring System Brady Road Resource Management Facility, Winnipeg, MB **City of Winnipeg**

For the Brady Road Landfill, greenhouse gas emissions have been calculated based on operational data and can be found in Appendix A.

### **4.0 CONDENSATE COLLECTION SYSTEM**

The purpose of the Condensate Collection System component of the LGCFS is to remove moisture from the landfill gas and to collect condensate from the collection laterals/header pipes. Collection and removal of the condensate increases the efficiency of the landfill gas collection in the wellfield and minimizes the moisture being passed through the mechanical system.

Condensate and moisture are removed from the system at three main locations. First, relative low points have been provided in the gas collection header to allow any free moisture to drain by gravity out of the underground gas collection system. In the wellfield, this moisture drains into condensate gravity style and pump style drain traps which have pneumatic pumps installed inside the sump. Next, prior to the gas entering the blowers, a condensate moisture separator removes most of the residual water droplets remaining in the gas. At this stage the residual water drains by gravity into the main condensate chamber.

The condensate chamber stores the water until the pump at the bottom of the chamber is activated either manually or automatically through a series of floats. The water is then pumped through a 75 mm diameter HDPE forcemain and is discharged into the leachate collection system.

As of the 2019 expansion work, Viridian VP4 pneumatic pumps are installed in nine manholes (MH3, MH4, MH5, MH8, MH31, MH32, MH33, MH42 and MH43). Leachate collected from these manholes is sent directly to the storage tank located in the southwest corner of the Site. As of the 2020 expansion work, QED AP3 pneumatic pumps were installed in 18 new dual-purpose wells and 57 existing gas wells were retrofitted for leachate collection. Condensate/leachate collected from the dual-purpose wells, pump drain traps, and the condensate chamber can either be sent directly to the storage tank or to MH32. Under normal operating conditions, condensate/leachate will be sent directly to the storage tank. If the storage tank is offline, leachate/condensate can be sent to MH32 by opening the isolation valve located on the condensate line to MH32.

### **5.0 CONCLUSIONS AND RECOMMENDATIONS**

1. During operation in 2022, the Brady Road Resource Management Facility Gas Collection and Flaring System operated as was intended. With the exception of the extended shutdown due to the header being compromised in March 2022.
2. During surface emission monitoring, some areas were noted where gas was escaping. These were identified in areas where surface cap was weak and pipe emanated from the landfill surface. In order to get maximum efficiency from the LGCFS, these issues should be looked at in the future.
3. Continue to investigate and develop a consistent maintenance program for the dual purpose pumps.
4. Add additional insulation or means to protect the dual purpose wells from freezing.

2022 Annual Report – Landfill Gas Collection and Flaring System  
Brady Road Resource Management Facility, Winnipeg, MB  
**City of Winnipeg**

5. The system should continue to operate on a full-time basis and be monitored according to the Operation and Maintenance Manual for the site.

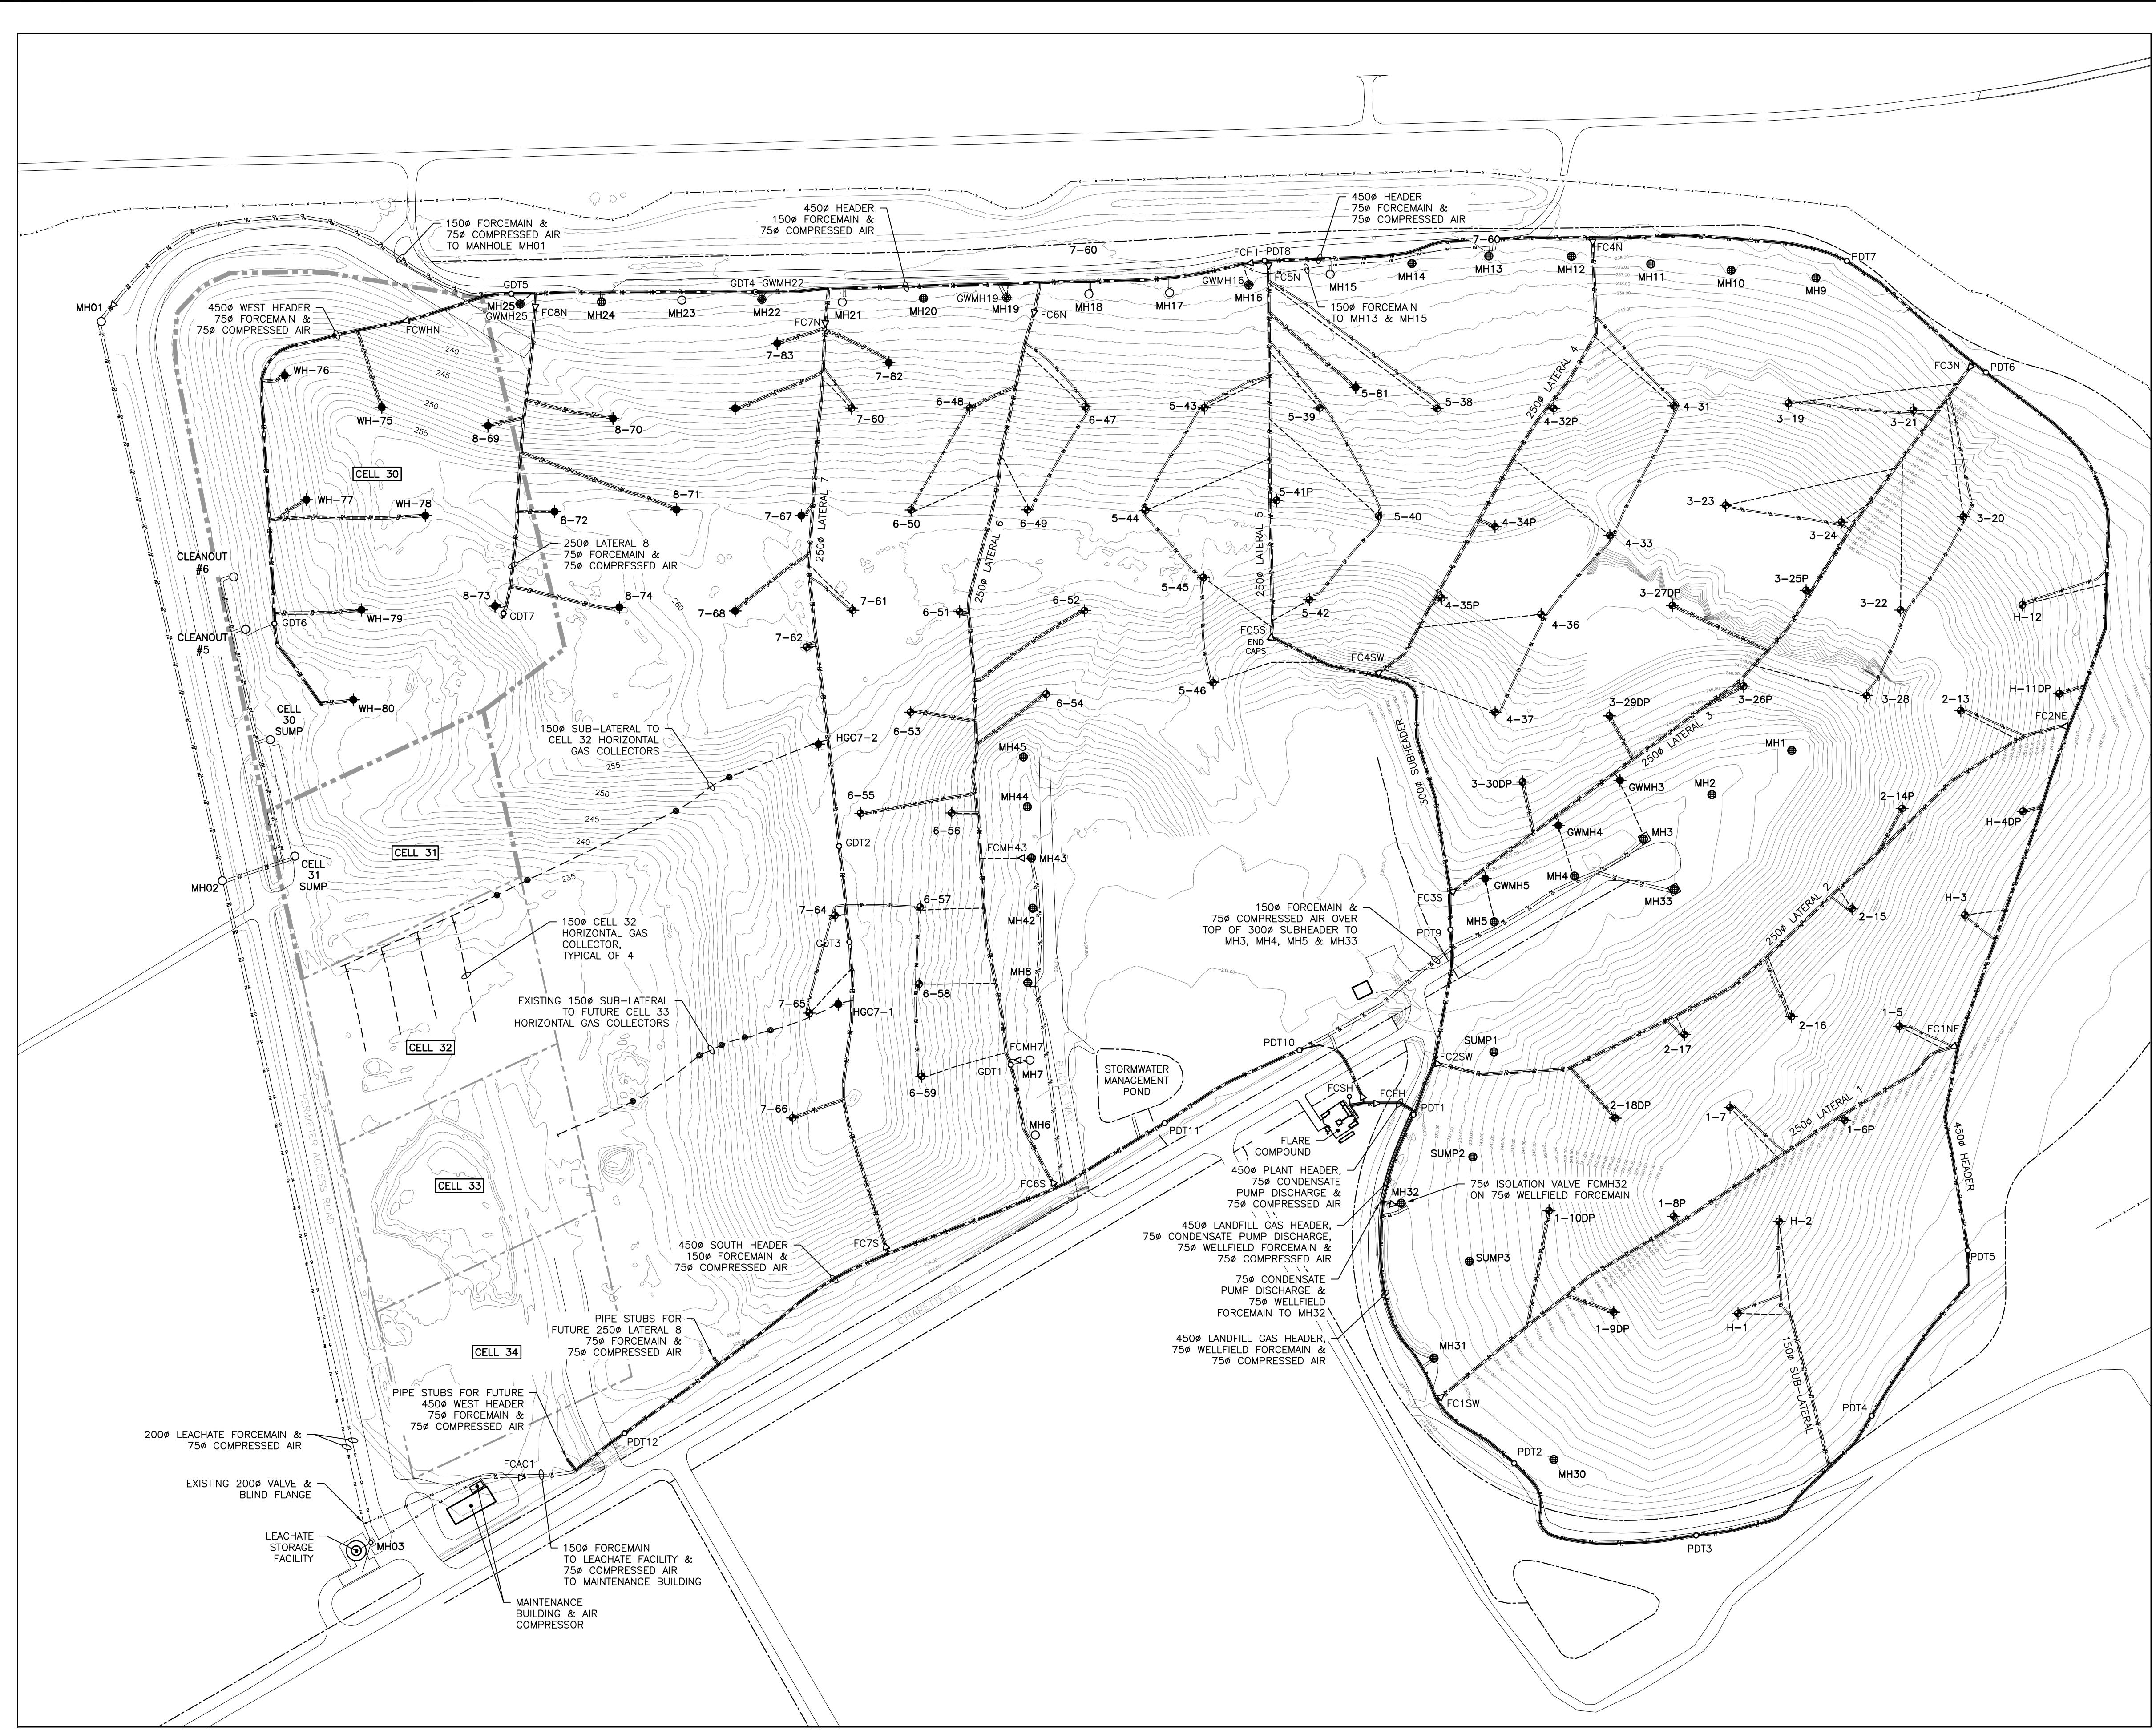

All of which is Respectfully Submitted,

**INTEGRATED GAS RECOVERY SERVICES**

**Table 2: Wellfield Monitoring Data**

Units	15-Jan-22	15-Feb-22	15-Mar-22	27-Apr-22	27-May-22	27-Jun-22	10-Jul-22	10-Aug-22	10-Sep-22	10-Oct-22	10-Nov-22	15-Dec-22
Notes:												
NLV No Lateral Vacuum - Indicates no reading was taken.												
0 Indicates a reading was taken, with no values registered Anemometer does not record flows below 0.4 m/s.												
A flow reading is typically taken even when the well is cracked.												
<<< Number too large to be displayed (over 500 ppm).												
closed Well is closed.												
1/2T Valve opened 1/2 turn												
1T Valve opened 1 turn												
2T Valve opened 2 turns

2022 Annual Report – Landfill Gas Collection and Flaring System  
Brady Road Resource Management Facility, Winnipeg, MB  
**City of Winnipeg**

## **APPENDIX B**

### Surface Emission Reports

June 5, 2022

Mr. Duy Doan  
Project Coordinator  
The City of Winnipeg  
1120 Waverly Street  
Winnipeg MB  
R3T 0P4

Project No. 9-457

Dear Mr. Doan:

**RE: Landfill Gas Emissions Survey  
Area 1 - Landfill Gas Collection and Flaring System  
Brady Road Resource Management Facility, Winnipeg, MB**

## **1.0 BACKGROUND**

As part of the Operations contract with the City of Winnipeg (City), Integrated Gas Recovery Services (IGRS) is required to perform Surface Emission Surveys (survey or sweep) during each calendar year to assess the effectiveness of the gas collection well field at the Brady Road Resource Management Facility (Site). In May 2022, IGRS performed the first survey of 2022. The survey will provide information on the performance of the landfill gas (LFG) collection system, and indicate any areas on the landfill surface that may require attention to limit amounts of LFG being released to the atmosphere. The results of the May 2022 survey can be compared to previous surveys completed as well as future surveys in order to determine areas that may consistently have high surface levels of LFG.

The flaring system was commissioned the week of July 8<sup>th</sup>, 2013. After completing the initial survey, the system has since been running on a constant basis with flow rates consistently between 800-1000 CFM.

This report discusses the results of the Surface Emission Survey, evaluates the emission and odour sources, and provides recommended remedial measures. The Surface Emissions Survey Protocol (Protocol) is included in Attachment A.

## **2.0 METHODOLOGY**

The survey is based on the United States Environmental Protection Agency's (USEPA) New Source Performance Standards (NSPS) for surface emissions monitoring at municipal solid waste landfills. The Protocol prepared by Comcor describes the procedures used for the survey and is included as Attachment A.

A Landtec SEM or similar with integral GPS, landfill gas surface emission monitor was used to perform the survey. A serpentine pattern was used to cover the entirety of the landfill site survey area. This path was tracked by GPS and is displayed in Figure 1.

### **3.0 OPERATIONAL AND SITE CONDITIONS**

The results of this sweep are a good initial indicator of the effectiveness of the gas collection system. After examining the results, areas indicating high levels of emissions may need to be reviewed to determine if remedial action is required.

The survey was performed over the entirety of the previously capped area, as well as the newly capped Cell 30 and Cell 31. The survey included areas where LFG collection wells are installed, and the active area where there is no LFG collection system. The survey was completed on May 4<sup>th</sup> and 5<sup>th</sup>, 2022 by Comcor staff. The LFG collection and flaring system had been running consistently, and all wells had been previously balanced prior to the sweep being performed to allow for optimal readings to be taken.

There was a large area currently active with cover and dumping operations, which is indicated by the black boxes on Figure 3, this area was not able to be effectively monitored due to the ongoing work.

Weather during this time period was also considered. During the dates on which the survey was conducted, the weather fell within the acceptable guidelines as outlined in Attachment A.

### **4.0 RESULTS**

#### Background Emissions

Background methane concentration readings are taken before a surface sweep is conducted in order to identify which surface emissions are results of the landfill, and which are from alternative sources offsite. Each day, prior to commencing the survey, Comcor took background concentration readings both upwind and downwind at a distance of 30 meters or more from the limit of waste. In all cases, readings were between 0-2 ppm, and no further action was required to correct readings taken during the survey.

#### Measured Emissions and Remedial Measures

In accordance with the Protocol, a minimum concentration of 400 ppm was used as the emission exceedance threshold. Figure 2 presents the locations of the emission exceedances.

The majority of the exceedances were directly related to gas escaping through the landfill surface. In most instances, the emissions were clearly indicated by the lack of vegetation on the affected area. Figure 2 presents the locations of the exceedances, of which, a number are clustered together. When compared with a map of the location of the header and laterals it is clear that the majority of exceedances arise from these locations. This is potentially caused by ineffective recapping of the area following the installation of the header, laterals, and more recently, the compressed air and forcemain lines to all wells. These areas are easily identifiable by the distinct lack of vegetation regrowth.

The remaining locations with exceedances were generally located on the top of the hill. This location remains unfinished, and is currently being recovered and capped. Due to the ongoing work in this area, it is difficult to determine the cause of the methane exceedances.

Special attention was paid to the areas that were previously excavated during the installation of the compressed air and forcemain lines during the 2020 construction project. These areas largely provided no indications of excessive methane escape. Four locations of significance were noted in the areas excavated around wells 4-35, 4-31, 6-49 and 6-50. All showed significant methane escape through the cap. This survey was completed following the excavation and re-covering with fresh capping material around these wells, indicating further action may required to reduce the elevated methane emissions.

Manholes were also directly monitored to test the effectiveness of the new air tight lids that were installed as part of the most recent construction project. Very low methane emissions were detected in the areas of the manholes with properly installed lids.

#### Vegetation and Clay Cap Condition

Special attention and observation were given to the condition of the clay cap and vegetation. Large cracks and ruts in the clay cap can allow gas to escape the landfill mound. Stressed or missing vegetation indicates that gas is escaping through the clay cap and is affecting plant/vegetation health.

While conducting the survey, Comcor observed many areas of stressed vegetation in addition to the areas that were previously noted. Many of these areas did not exceed the methane threshold, however they will need to be monitored in the future for issues that may arise from potential gas emissions.

## **5.0 CONCLUSIONS**

The number of exceedances recorded since the most recent survey in November 2021 have decreased. The exceedances can vary between surveys due to the generally low vegetation

growth on Site. The generally limited vegetation makes it more difficult to identify specific areas with low vegetation growth directly due to methane exceedances.

Overall, the majority of the landfill has sufficient cap, or cap in good condition. Continued monitoring and Surface Emission Surveys in the future will determine if there are any areas where the clay cap is allowing methane emissions to escape. If this continues, these areas may require maintenance.

If you have any questions or concerns, please contact the undersigned.

Yours truly,

**COMCOR ENVIRONMENTAL LIMITED**

Jordan DeMerchant

Project No. 9-457

Dear Mr. Doan:

**RE: Landfill Gas Emissions Survey  
Area 1 - Landfill Gas Collection and Flaring System  
Brady Road Resource Management Facility, Winnipeg, MB**

## **1.0 BACKGROUND**

As part of the Operations contract with the City of Winnipeg (City), Integrated Gas Recovery Services (IGRS) is required to perform Surface Emission Surveys (survey or sweep) during each calendar year to assess the effectiveness of the gas collection well field at the Brady Road Resource Management Facility (Site). In December 2022, IGRS performed the final survey of 2022. The survey will provide information on the performance of the landfill gas (LFG) collection system and indicate any areas on the landfill surface that may require attention to limit amounts of LFG being released to the atmosphere. The results of the December 2022 survey can be compared to previous surveys completed as well as future surveys in order to determine areas that may consistently have high surface levels of LFG.

The flaring system was commissioned the week of July 8<sup>th</sup>, 2013. After completing the initial survey, the system has since been running on a constant basis with flow rates consistently between 800-1000 CFM.

This report discusses the results of the Surface Emission Survey, evaluates the emission and odour sources, and provides recommended remedial measures. The Surface Emissions Survey Protocol (Protocol) is included in Attachment A.

Due to the surface emission sweep being conducted in the winter, and much of the Site being inaccessible during this time, the scope of the sweep was limited to areas of the landfill where large amounts of emissions were believed to be escaping. The effectiveness of the sweep in the areas that were measured was also impacted by the large amount of snow on the surface of the landfill. Excess snow can mute or hide potential emissions, resulting in the emissions registered during this sweep being significantly lower than previous sweeps conducted.

## **2.0 METHODOLOGY**

The survey is based on the United States Environmental Protection Agency's (USEPA) New Source Performance Standards (NSPS) for surface emissions monitoring at municipal solid waste landfills. The Protocol prepared by Comcor describes the procedures used for the survey and is included as Attachment A.

A Landtec SEM or similar with integral GPS landfill gas surface emission monitor was used to perform the survey. A serpentine pattern was used to cover a portion of the landfill Site survey area. This path was tracked by GPS and is displayed in Figure 1.

## **3.0 OPERATIONAL AND SITE CONDITIONS**

The results of this sweep are a good initial indicator of the effectiveness of the gas collection system. After examining the results, areas indicating high levels of emissions may need to be reviewed to determine if remedial action is required.

The survey was performed on capped Cell 30 and Cell 31. The survey included areas where LFG collection wells are installed, and the active area where there is no LFG collection system. The survey was completed on December 7<sup>th</sup>, 2022 by Comcor staff. The LFG collection and flaring system had been running consistently, and all wells had been previously balanced prior to the sweep being performed to allow for optimal readings to be taken.

Weather during this time period was also considered. On the day the survey was conducted, the weather fell within the acceptable guidelines as outlined in Attachment A.

## **4.0 RESULTS**

### Background Emissions

Background methane concentration readings are taken before a surface sweep is conducted in order to identify which surface emissions are results of the landfill, and which are from alternative sources offsite. Prior to commencing the survey, Comcor took background concentration readings both upwind and downwind at a distance of 30 meters or more from the limit of waste. In all cases, readings were between 0-2 ppm, and no further action was required to correct readings taken during the survey.

### Measured Emissions and Remedial Measures

In accordance with the Protocol, a minimum concentration of 400 ppm was used as the emission exceedance threshold.

Due to the limited scope of the survey only one exceedance was detected. This exceedance was directly at the base of an LFG well, however no odour was noticeable by Comcor staff. Figure 1 presents the locations of the emission exceedance, represented with a star.

## **5.0 CONCLUSIONS**

As stated previously, due to the survey being completed during the winter and the limitation previously noted, it is difficult to draw conclusions from the results. While not exceeding the 400ppm threshold a number of readings were noted directly surrounding the tipping face. In addition, the area around the tipping face was the largest contributor to odours in the area. Continued monitoring and Surface Emission Surveys in the future will determine if there are any areas where the clay cap is allowing methane emissions to escape. If this continues, these areas may require maintenance.

With the large amount of capping operations currently occurring on the Site. A full sweep of the entire Site in spring will provide a fuller picture of the state of the cap.

If you have any questions or concerns, please contact the undersigned.

Yours truly,

**COMCOR ENVIRONMENTAL LIMITED**

Jordan DeMerchant

## SURFACE EMISSIONS SURVEY PROTOCOL

### **1. OBJECTIVE AND BACKGROUND INFORMATION**

The objective of a Surface Emission Monitoring Plan is to complete a gas assessment within a landfill footprint.

The landfill gas emissions survey is based on the United States Environmental Protection Agency's (USEPA) New Source Performance Standards (NSPS) for surface emissions monitoring at municipal solid waste landfills. Background methane concentration should be taken before each emissions survey and will be determined by monitoring upwind and downwind outside the boundary of the landfill at a distance of at least 30 metres from the limit of waste. The on-site emission survey is to be conducted as described within this document.

### **2. MONITORING MAP**

- A grid will be imposed on the available site maps. This grid will cover all areas of the landfill. The grid shows the path to be followed by the individual(s) who perform surface monitoring. The grid will be set up at 30 meter intervals.
- The maps will show the location of all gas monitors, each of which is shown with a unique identifier.
- The monitoring grid map may also indicate each area that is excluded from surface monitoring. Each excluded area is labeled and an attachment to the map has been prepared to explain the basis for each area's exclusion from monitoring. The following areas are excluded from required monitoring:
  - 1) Slopes that are determined by the individual(s) performing the monitoring to be too steep to be safely traversed while carrying the monitor.
  - 2) Areas containing only waste other than Municipal Solid Waste (for example, “construction and demolition” debris, kiln ash, etc.).
  - 3) Areas of known asbestos disposal.

### **3. INSTRUMENT AND CALIBRATION GAS SPECIFICATIONS**

- All instruments will be field calibrated and have certification from the manufacturer or rental supplier.

#### **4. MONITORING SCHEDULE**

- Under the NSPS, quarterly monitoring is required for all landfills that require a gas collection system (GCS). A landfill that can demonstrate that surface concentrations are below 500 parts per million by volume (ppmv) measured as methane in four consecutive quarters do not require a GCS.
- Any closed landfills that has surface concentrations not to exceed 500 parts per million by volume (ppmv) measured as methane in four consecutive quarterly monitoring periods may conduct annual monitoring.
- Monitoring will only occur if conditions are appropriate. Below is an outline of reasons that monitoring may not be able to be completed.
  - 1) Weather that is determined by the individual(s) who perform the surface monitoring to be unsafe in which to conduct outdoor activities or which may be damaging to health (i.e., extremes of temperature, high winds, rain-snow-ice or thunder storms, snow and ice accumulation, darkness, ozone alerts, other air pollution alerts).
  - 2) Occurrence of meteorological conditions considered to be other than “typical”.
  - 3) For Tier 4 Landfills, average wind speed (on a 5-minute interval) must not exceed 40 km/h (25 mph).
  - 4) Ambient temperatures which do not rise above the minimum required ambient operational temperature of the monitoring instrument.
  - 5) Ambient temperatures which do not fall below the maximum allowable ambient operational temperature of the monitoring instrument.
  - 6) Accumulation of snow/ice to a depth in excess of the maximum allowable monitoring height-above-surface (i.e., 10 cm. = 4 inches).
  - 7) Wet surface conditions such that traversing the landfill would either present a hazard to the individual(s) performing the monitoring, or would damage the cover and potentially result in the creation of methane leaks.
- Where a delay in the monitoring schedule has been caused by one or more of the above conditions, monitoring will resume as soon as the condition(s) which precluded meeting the monitoring schedule subside. Documentation will be entered into the report detailing the regular monitoring schedule and conditions in which they were completed.

---

## 5. MONITORING PROCEDURE

- Conduct monitoring **only if** ambient temperatures are within acceptable operating limits for the monitoring instrument; there is no snow/ice cover greater than four inches deep, weather conditions are “typical” for the area, and weather and site conditions are such that it is not dangerous to conduct monitoring.
- For Tier 4 Landfills, conduct monitoring **only if** average wind speeds are below 40 km/h (25 mph). Utilize a wind barrier if average wind speeds exceed 6.4 km/h (4 mph) or gusts exceed 16.1 km/h (10 mph). Average wind speed to be determined every 5-minutes in an open area using an on-site anemometer with a continuous recorder and data logger for the entire monitoring event.
- Warm up the instrument per the manufacturer’s recommendations.
- Perform an instrument calibration prior to each monitoring day.
- At a distance of 30 meters (98 feet) from the perimeter wells on the upwind side of the landfill, face into the wind and move the probe in the air for at least 30 seconds.
- Note the meter reading and record it as “upwind reading”.
- Perform the same procedure at a distance of 30 meters (98 feet) from the perimeter wells on the downwind side of the landfill and record the meter reading as “downwind reading”.
- Average the upwind and downwind readings and record the average in “background concentration”.
- Using the surface monitoring grid map, begin walking the sampling path at the starting point on the map holding the monitor probe no more than four inches above the landfill surface. Walk at a steady pace of approximately 1.5 mph (approximately 1 step per second).
- When the instrument gives a meter reading of  $\geq 500$  ppm, stop walking and note the maximum meter reading. Record the time of detection and a unique location identifier from the GPS unit. It may be necessary to create a location identifier on the sampling grid map.
- Continue walking the sampling grid path until the entire route has been traversed.

- While traversing the grid, if any areas are seen off of the grid path that appear to have a high potential for methane leaks (i.e., stressed vegetation, noticeable surface cracks, sunken areas, etc.), deviate from the grid path and monitor these areas as if they were on the grid path. Cover penetrations such as wellheads, vents and posts that pass through the cover of the landfill must also be monitored. Document these areas only if a leak is recorded.
- If the portable PID/FID gas monitor gives a reading above its detectable limits use the GEM to determine methane levels.
- All areas of stressed vegetation, noticeable surface cracks, sunken areas, etc. should also be noted and the location recorded. If possible take digital pictures to record any extreme conditions.

## 6. MEASURED EXCEEDANCES

- If methane is detected at a concentration greater than 1000 ppm above background, the following steps may be taken until the exceedance is remedied:
  1. The location and concentration of the exceedance will be recorded.
  2. Adjustments to adjacent extraction wells will be made to increase gas collection in the vicinity of the exceedance. The location will be re-monitored within ten (10) calendar days of detecting the exceedance.
  3. If re-monitoring the location shows a second exceedance, cover maintenance will be performed. The location will be re-monitored within ten (10) calendar days of maintenance.
  4. If re-monitoring shows a third exceedance, consideration will be given to installing additional landfill gas extraction wells.

**Table 11. 2022 Nuisance Complaint Monitoring**

Date	Complaint	Response
5/4/2022	Citizen states that Brady smells. They don't cover it as per usual. Flare might not be running as usual.	Informed the citizen that the atmospheric conditions and wind on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/6/2022	Citizen states that there was a potent smell coming from Brady on June 1. This was smelled at 2:00 a.m.	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/7/2022	Report received via email dated May 24. Citizen is complaining about the Brady Landfill odour. Citizen states they don't cover it as per usual and flare might not be running as usual.	Informed the citizen that the atmospheric conditions and wind on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/15/2022	Citizen says that the smell from the Brady Landfill has been really strong all day. Caller would like something done about it as no matter what side of the landfill he is on, it smells.	Informed the citizen that the atmospheric conditions and wind on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/15/2022	Citizen lives in Prairie Point and is complaining about the intense smell that is coming from the Brady Rd Landfill. Citizen states that on the morning of 06/15/22, the odor was very strong; citizen found it hard to breath.	Informed the citizen that the atmospheric conditions and wind on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/19/2022	Citizen states that they are once again experiencing the smell coming from Brady Landfill and would like them to investigate again, please and thank you.	Informed the citizen that the atmospheric conditions, temperature, south wind and higher humidity on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/22/2022	Citizen reports, "city did not do the odour control this year at the Brady Landfill and the smell is pretty bad". Please look into this request for the odour control as soon as possible.	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/22/2022	Citizen states that it started smelling like the landfill around 6:30 this evening in South Pointe. Very strong offensive odour.	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/22/2022	Citizen says that at 6:00 p.m. there is a foul odor from Brady Landfill (sour smell). Odor still persisting after 9:00 p.m. causing shortness of breath, and nausea.	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/22/2022	Citizen lives in Prairie Point and can smell garbage smell coming from the landfills area. Today it was unbearably bad. Please inspect it and inform when it will be taken care of.	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/23/2022	Citizen states, "The garbage smell from Brady Landfill has been exceptionally bad this week. The smell is very bad and keeps us from enjoying our outdoor space in our home during the summer months. Something really needs to be done to mitigate this."	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/23/2022	Citizen reports they noticed yesterday afternoon that the smell coming from Brady Landfill got a lot stronger. Citizen states they cannot go outside at all today, the smell is very strong and needs to be addressed.	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
6/25/2022	Citizen says via email received June 7, "Potent smell coming from Brady."	Informed the citizen that the atmospheric conditions (south wind and higher humidity), and police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/6/2022	Email received on July 6, citizen is reporting unusually bad smell that is blowing in the Prairie Pointe area today. It wasn't this bad unlike other days, however today is exceptionally worse.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/6/2022	Citizen states, "Just reporting that there was a strong foul odour in the entire Prairie Pointe neighborhood around 11 PM today. Likely from Brady Landfill.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/9/2022	Emailing regarding odour complaint on June 18th at 5pm. Email received July 9th, contained necessary info such as phone number and name to complete request.	Informed the citizen that the atmospheric conditions, police investigation, and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/10/2022	Email received on July 10, citizen is reporting landfill smelled on Friday, 8th, starting around 7:50pm and on Saturday, 9th, the smell was intermittent in the evening.	Informed the citizen that the atmospheric conditions, police investigation, and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/14/2022	Citizen states, "It currently smells like the landfill in South Pointe. There was a foul landfill odour in the morning earlier this week as well."	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/15/2022	Citizen says a foul smell periodically wafting into Brio Townhouses on Eaglewood Drive, west of the Brady Road Landfill. Most recently at 10 p.m. tonight.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.

## Brady Road Resource Management Facility Annual Report – 2022

Date	Complaint	Response
7/15/2022	Citizen states, "Just reporting that there was a strong foul odour in the entire Prairie Pointe neighborhood around 11 PM today. Likely from Brady Landfill."	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/18/2022	Citizen states they have lived in Prairie Pointe since 2020. They have found that sometimes the smell from Brady Road Landfill is very bad. This summer, it happens quite often.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/26/2022	Citizen reports they live in Prairie Point and there is an odour from the dump which is closest to them.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/27/2022	Citizen says they live in Prairie Point and there is an odour from the dump which is closest to them. The smell is quite often. It is such a strong bad smell that it is very hard to sit or walk/stay outside of the house. The smell prevents outside activities.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/29/2022	Citizen lives in Prairie Pointe, the Brady Landfill is just around the area. Today when they came home this afternoon, they noticed a pungent smell they believe is coming from the landfill as it smells kinda like garbage.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/29/2022	Email received on July 29 - citizen reports odour concerns from the landfill around 10 PM.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/29/2022	Citizen states that there is foul odour coming from the landfill which is making the air stink a lot.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/29/2022	Email received on July 29 - Citizen states the dump was particularly pungent at approximately 9:15 p.m. this evening. Citizen lives in Bridgewater Lakes however also smelled it at Cineplex on McGillivray at approximately 9:00 p.m.	Informed the citizen that the atmospheric conditions, landfill operations, and additional animal waste suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/29/2022	Citizen says that there is a very foul order coming from Brady Landfill.	Informed the citizen that the atmospheric conditions, landfill operations, and additional animal waste suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/30/2022	Email received on July 29 - citizen says the air quality was terrible in her area due to the odour from the landfill.	Informed the citizen that the atmospheric conditions, landfill operations, and additional animal waste suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/30/2022	Citizen emailed on July 14th to report a very "foul odor" from the Brady Road Landfill apparently filled up the Prairie Pointe neighborhood on the day the email was submitted.	Informed the citizen that the atmospheric conditions, additional animal waste and ongoing police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/30/2022	Email on July 14: Citizen states that there was a strong foul odour in the entire neighborhood around 6:50 AM and then again at 9:30 PM today. Likely from Brady Landfill.	No response needed, as this citizen just wants to report in and doesn't require a response unless they ask for one.
7/30/2022	Citizen is reporting that there is a very bad odor coming form the dump this summer and it has been frequent and unbearable.	Informed the citizen that the atmospheric conditions, additional animal waste and ongoing police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/30/2022	Citizen would like to advise that there is a strong foul odor coming from the Brady Landfill	Informed the citizen that the atmospheric conditions, additional animal waste and ongoing police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/30/2022	Email on July 15th - Citizen lives in Prairie Pointe and notices a smell in the area more consistently than last year. At 10:16 on Friday July 15th, with no wind and the smell is quite foul. Email on July 30th - At 7:57 the area is smelling like the dump again.	Informed the citizen that the atmospheric conditions, additional animal waste and ongoing police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/30/2022	Citizen wants to speak to someone about the really bad odour from Brady Landfill. He states it has been really bad for the past 3 days. He states he wants to plan activities for people in the neighborhood, and they can't enjoy due to the smell.	Informed the citizen that the atmospheric conditions, additional animal waste and ongoing police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
7/30/2022	Citizen is reporting that there is a strong odour coming from Brady Road Landfill. Citizen claims her windows are closed, and she still smells it. It is giving her migraines.	Informed the citizen that the atmospheric conditions on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community, and that the odours are not harmful to human health.
8/21/2022	Email on August 20 - Citizen is writing to complain about odour from Brady Landfill. The odour became very strong since around 9pm today. It is a health hazard."	Informed the citizen that the atmospheric conditions on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community, and that the odours are not harmful to human health.
8/21/2022	Email on August 20 - Citizen states "the smell has been super strong lately, especially tonight."	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
8/21/2022	Email on August 21 - Citizen says "The smell in the South End is atrocious. We have lived in the same location for four years and have only smelt this smell twice. Since Spring 2022, every day it smells like garbage. It is disgusting and does not improve.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
8/22/2022	Email on August 21 - Citizen reports a horrible smell in Prairie Pointe the past 2 months but was the worst this week. It's hard to enjoy time outside because of this smell. It smells like the landfill.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.

**Client File No. 5556.00**  
**Manitoba Environment Act Licence No. 3081 R**

## Brady Road Resource Management Facility Annual Report – 2022

Date	Complaint	Response
8/31/2022	In Prairie Pointe in Winnipeg's South End, the smell is very bad today.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/6/2022	Citizen states there is a lot of strong, pungent odour of methane gas smells coming from the nearby Brady dump. They believe this may be contributing to nausea, headaches and dizziness.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/6/2022	Citizen states there seems to be a really bad odour coming from the Brady landfill. The smell is strong at their property, the air is not breathable.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/9/2022	Citizen says, over the last 5-10 years the smell has gotten more frequent. Clearly not enough is being done since this problem NEVER occurred during the first 15 years or so that he was here.	Informed the citizen that the City takes concerns very seriously and continues to work to mitigate potential odour sources generated from operations at Brady Road Resource Management Facility by collecting information about the odours encountered by residents in the area.
9/10/2022	Email on September 2 - "This email is to communicate to the City the terrible odour coming from the landfill (Brady Resource Management Facility). The smell is so strong that my kids are not willing to leave the house, we have to keep everything closed and AC on all the time.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/11/2022	Citizen reports that the Brady Landfill could be smelled from citizen's house by the Bridgewater area.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/11/2022	Email received on September 11, citizen is reporting a very bad smell/odor from Brady Landfill.	Informed the citizen that the City takes concerns very seriously and continues to work to mitigate potential odour sources generated from operations at Brady Road Resource Management Facility by collecting information about the odours encountered by residents in the area.
9/11/2022	Email received on September 11, citizen is reporting that the smell from Brady Landfill is terrible. Citizen states today, evening and afternoon had so much smell in their area.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/12/2022	Citizen says the smell from the landfill is bad	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/12/2022	Email received on September 12 - citizen is reporting a really bad smell from the Brady Landfill. It has been ongoing for 48 hours and coming in through their home.	Informed the citizen that the City takes concerns very seriously and continues to work to mitigate potential odour sources generated from operations at Brady Road Resource Management Facility by collecting information about the odours encountered by residents in the area.
9/12/2022	Email on September 7 - Citizen states "I am staying at the Four Points Sheridan on Pembina South. I was woken by a bad odour around midnight. It's really bad. I checked all floors and then went outside. The smell outside is very strong. It smells exactly like the landfill when driving by on a day with a south wind.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
9/30/2022	Email on July 14 - Citizen states the odour from the landfill is excessive today.	Informed the citizen that the atmospheric conditions, additional animal waste and ongoing police investigation suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
10/7/2022	Citizen says that they were just outside and the landfill smell is horrid – worst they've ever smelled it.	No response needed, as this citizen just wants to report in and doesn't require a response unless they ask for one.
10/7/2022	Citizen says they are currently experiencing a strong odour that smells like garbage. (Brady)	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
10/7/2022	Email on October 7 - Citizen is reporting the foul smell stinking today at Prairie Pointe. Tonight is really bad. They sneezed a lot and got a runny nose and immediately went inside the house.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
10/11/2022	Emailer states that for three days now the odours coming from Brady Road landfill are awful.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
10/27/2022	Citizen reports a strong odor coming from Brady Landfill in the neighborhood of Prairie Pointe	Informed the citizen that the City takes concerns very seriously and continues to work to mitigate potential odour sources generated from operations at Brady Road Resource Management Facility by collecting information about the odours encountered by residents in the area.
10/29/2022	Citizen states that they are experiencing foul stench of smell Friday night and Saturday Oct 29. Citizen states residents of Prairie Pointe were unable to enjoy their weekend outdoors due to the sickening smell of City dump.	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.
10/30/2022	Citizen reports they live in the Prairie Pointe neighbourhood of the City and have lived there for 2 years. Since they moved in the smell from the Brady Landfill has gotten increasingly worse. Today was especially bad.	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.
10/30/2022	Citizen says "I will like to complain about the smell from the dump - please file a complaint on my behalf."	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.
11/8/2022	Citizen is requesting "Please help us lessen the capacity and intensity of the smell from Brady Landfill, currently the smell is so strong in our community.	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.

## Brady Road Resource Management Facility Annual Report – 2022

Date	Complaint	Response
11/16/2022	Citizen is reporting a foul smell in the air likely coming from Brady.	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.
11/16/2022	Citizen reports that there was a strong foul odour in the Prairie Pointe and Bridgewater neighborhood through most of the day today. Likely from Brady Landfill.	No response needed, as this citizen just wants to report in and doesn't require a response unless they ask for one.
11/17/2022	Caller states that for the last 2 - 3 months they have been smelling an odour outside. The odour occurs more frequently about 2 - 3 times a week. They smell the odour in the early evenings. It's a gas smell and could be coming from the landfill.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
11/22/2022	Citizen states, "Brady Landfill is giving out really bad smell. It's so bad that we can smell it inside our home this time. It smells like really bad methane gas. Please look into this ASAP"	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
11/22/2022	Citizen reports a strong odour at the Brady landfill on Monday, November 21 at 4:25pm.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
11/23/2022	Citizen states, the Brady Landfill is just around their area. They notice the smell possibly coming from the Brady landfill since the previous night.	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.
11/23/2022	Citizen says the smell from the dump is very very bad right now, usually there are no smells in the winter but this year there have been many.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
11/24/2022	Citizen says that Brady Landfill is creating smell and it is unbearable. He says that the smell has started to come to the neighborhood and it is so hard in the houses, even when all the vents are running.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
11/25/2022	Citizen states that they have noticed a significant amount of times the landfall has a odour.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
12/3/2022	Citizen is reporting strong garbage odor tonight. Citizen has several reports in the past.	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.
12/6/2022	Citizen is reporting that landfill seemed particularly smelly on December 5, at 9:40pm.	Informed the citizen that the landfill gas collection system on the Northwest area of Brady is undergoing repairs. This can produce some unpleasant gassy odours, during the past couple of weeks. The City is working hard to complete the repairs as quickly as possible.
12/10/2022	Citizen states there is an odour from the Brady Landfill today. They've smelt it quite often the past few weeks and will start reporting it.	Informed the citizen that the atmospheric conditions and landfill operations on that day suggest that it would be likely the odour originated from Brady Landfill. Also described the steps taken to reduce the impact of the landfill on our community.
