What will happen to the NATIVE plants in the area that I have been harvesting for years such as Sage and Wild Mint amongst others?

Hi Leslie,

When the existing ground surface is lowered to construct the storm retention basin, vegetation within the footprint will be removed.

Once construction is complete, it will be revegetated with native wetland species in and around the shoreline, and with native tall and medium grass species and wildflowers in the upland areas.

The exact species will be based on local availability at the time of planting, but will be selected based on seed species similar to our local plant hardiness zone. Sage is among the seed species that may be planted.
